size I have a video in h264 codec. The video file size is around 300 mb. I want to convert this video into 4K video and get size around 3.5 gb. I have tried two softwares Kdenlive and OpenShot. both the softwares are not giving a good result. I am getting only frame boundaries. I am attaching a video file. A: Well, this is most certainly doable with ffmpeg - it can take a H.264 video source and transcode it to a 4k H.264 output file in a few seconds. I have done similar things before, on more problematic sources. I have also done some 4k source H.264 in order to test the quality of the conversion before transcoding a 4k H.264 to a 4k H.264. I have found it to be completely stable and quality wise there's no difference. So try this: `ffmpeg -i file.avi -target nsc-vbr -maxrate 300000 -bufsize 1800000 -c:v h264 -preset ultrafast \-movflags faststart -an -f msc 4koutpuffile.avi` You will need to have the correct codecs installed to do a good job. Try setting the `-c:v h264` codec (it does a good job transcoding H.264). That should get you to what you want. Q: How can I use binding in my Angularjs web application? I am new to Angularjs. What I wanted to do was to get binding between two different views in my application. I wanted to get the link in the navbar, for example to have a href in my web page that link to the edit page. I am using Django and Angularjs. Thanks. Edit: The case is, I have a sidebar that I added the default Angularjs navbar to it. I want to use the link in the navbar to redirect the user to the edit page of a specific movie. What I have is `Scope.loadMovie=function(){ $http(method: 'GET', url: '/api/movies/' + 82157476af`
